1 FinBot

The perfect bot for your bank

How can a bank's service bot offer a really good user experience?

Banks move more and more of their customer service to chatbots, voicebots and avatars. Many of these bots are still rule-based, and their answers are not personalised and often miss the question. People who use ChatGPT or Claude expect more, and no bank has shown a best-practice solution yet.

PRACTICE

- Banks, or providers they commission, run the bots: chat, voice, rarely avatars.
- Typical tasks: the nearest ATM, a locked PIN, push-TAN, a letter from the bank.

RESEARCH

- Cooperative and social service bots (Gnewuch et al., 2017); human-like cues (Adam et al., 2021).
- Open tension: a voicebot needs seconds to answer, which feels unnatural.

USERS

- Everyone who deals with a bank. Your team picks a pain point or a user group.
- They expect the basic standard they know from modern chat tools.

OPEN QUESTIONS

01 Why do bank service bots disappoint people who are used to ChatGPT?

02 Which moments of service matter most to customers?

WHAT YOU GET

- A benchmark study of bank bots, with links to try them
- Three core papers
- Insights from the FinBot project, in a meeting with Amilia
